

Pull Request & Workflow Guide

Event Booking Mini Project 02 | Team 4 Standard Operating Procedures

Part 1: For Team Members (Submitting a Pull Request)

When you complete your assigned task on your individual branch (named `mini-project-username`), follow these steps to integrate your code securely:

- **Step 1: Commit and Push Your Work**

Open your terminal in the project folder, stage your changes, commit with a descriptive message, and push to your designated remote branch:

```
git add .
git commit -m "feat: complete assigned task for [feature name]"
git push origin mini-project-username
```

- **Step 2: Open a Pull Request on GitHub**

Go to the repository on GitHub. A yellow banner prompting "**Compare & pull request**" will appear next to your branch. Click it (or go to the *Pull Requests* tab and click *New pull request*).

- **Step 3: Configure Base and Compare**

Set the **base** branch to `main` and the **compare** branch to your personal branch. Write a clear title summarizing your updates and click **Create pull request**.

Important Rule: Direct pushes to the `main` branch are blocked by repository protection rules. Every feature must go through a Pull Request review.

Part 2: For the Team Leader (Reviewing & Merging)

As the Team Leader (Allaith), you hold sole authority to review code quality and merge updates into the protected `main` branch.

- **Step 1: Access Open Requests**

Navigate to your GitHub repository and click on the **Pull Requests** tab to view submissions from team members.

- **Step 2: Inspect Code Changes**

Click on the target Pull Request and open the **Files changed** tab. Review additions (green) and deletions (red) to ensure they adhere to project requirements and API contracts.

- **Step 3: Approve the Pull Request**

Return to the **Conversation** tab, click **Review changes**, select **Approve**, and submit your review (fulfilling the branch protection policy).

- **Step 4: Merge into Main**

Click the green **Merge pull request** button, then confirm the merge.

- **Step 5: Synchronize Locally**

Pull the latest changes onto your local machine via VS Code to keep your environment completely up to date:

```
git checkout main
git pull origin main
```

Team Success Tip: Run regular team check-ins to ensure that all backend controllers and frontend screens integrate smoothly after every major merge.
